

Software Quality Assurance

Tutorial 10

Task 1

Implement a function `HandleStr` that takes an input string, capitalizes the first letter of each word that started by u,v,t,k, and writes the processed string to a file that has file path inputted as an input parameter of the function, with each sentence (hint: symbols end of sentence are `.?!)` stored on a separate line. Remember to handle exception cases.

Draw Activity diagram then create Flow Graphs based on the Activity diagram and determine the Cyclomatic Complexity.

Task 2

Create test cases to achieve 100% Condition Coverage (which is generally stronger than Branch/Decision coverage, refer to [Lecture 10](#) for details) for task 1.
