

Software Quality Assurance

Tutorial 11

Exercise 1: Scan website

Task

By using website <https://pentest-tools.com>, test at least two times some websites (Ex: <http://testaspnet.vulnweb.com:80/>) step by step as follows:

- Scan single website, using light scan. Ex: <http://testaspnet.vulnweb.com:80/>

View and export the Report. Then, compare the results of two scans to see if there are any differences and list the top 3 most critical vulnerabilities found (if exist).

Exercise 2: Scan system

Preparation

Download Nmap software for Windows and Linux: <https://nmap.org/download>

Task

Create some processes to test at least two times some system step by step as follows:

- Check status of system: `#nmap -sn [IP of destination]`
- Check OS system: `#nmap -O [IP of destination]`
- Check status port (Open or closed): `#nmap -p [number port] [IP of destination]`; `#nmap -p [number port]-[number port] [IP of destination]`;
- Check TCP Connection: `#nmap -sT [IP of destination]`
- Check UDP Connection: `#nmap -sU [IP of destination]`

View and export the Report. Then, compare the results of the two scans and list all open ports along with their corresponding services.
